Getting Started

Dependencies

> **NOTE**: We support both Linux and MacOS systems. You might have some luck using the Linux Subsystem for Windows, but we don't pretend to support it.

Eleanor requires `python>=3.14` and one external runtime dependency:

1. A slightly modified version of EQ3/6 found at 39alpha/eq3_6. Future versions will likely add other kernels based on other speciation tools, but EQ3/6 is what we have now.

A PostgreSQL server is required only if you use the `postgres` output sink (recommended for large-scale runs).

There are two dev dependencies required for installation:

1. `gfortran` - you should be able to install `gfortran` with your system's package manager (e.g. homebrew)
2. `meson` - I recommend installing this via `uv`. See Installation below.

Installation

I highly recommend using `uv` to install eleanor:

```
uv tool install meson # If you haven't installed meson already
```

```
uv tool install git+https://github.com/39alpha/eleanor
```
